1)Login to Tranzila and go to Settings -> Config 1

Tranzila Login URL: https://secure5.tranzila.com
UserName : (your username)
Password:(your password)

At the “ Respond to a User Agent object including http headers” section –

Enter Server IP 72.52.101.28
or Enter our subnet: 72.52.101.0/27

-     Easier way to setup “ Include Variables in return string” is to select NO
-     However,if merchant wants to choose YES then --- do NOT select “FULL CC
number”. We do not use these other variables so only choose “ Include only last 4
digits ofCC number”.

 2)Config 2
 Make one user defined field “ orderid” – the merchant must use this defined
field otherwise Tranzila will not work. See screenshot below:

More importantly, you can check more information on the value of the return variable response by
going to Settings -> Config 2 and click on thelink “ Here's a List of all possible Shva
responses.” For example,Variable Response 003 means Contact credit company (suspect
order),response 000 = transaction approved, response 004 = refusal, etc.
