When the images are no longer in the correct directory where it used to be in V5, it will show a prompt that the image could not be found. If it can't find the image in the location that is stored in the v5 database, you can choose to select a different folder to find the image. They can also choose to ignore subsequent images when it can't find one.

This dialog will appear:

The file open dialog will appear when OK is clicked. This is where the user selects the folder that the image is in. Once a folder is selected, the folder will be remembered in a list by the upgrader. The upgrader will look for images in the list of remembered folders. If still not found, the above dialog appears and the process repeats.

The "Ignore all missing images" checkbox, if ticked, means that all subsequent missing images will be ignored.
