If you have added a page and want to move it into a different location, you can simply drag the page into its new position with your mouse. In normal mode, locate the left tree menu and select the category/page you want to move.

Just click on the page with your left mouse button, keep the button pushed down, and move the page into its new position. All child pages owned by the page you are moving will automatically be moved as well. Note that you can move a page into a subpage or vice versa.

Also all links added with the [Link to other pages, paragraphs](#) and websites or [Cross Promotions](#) functions will also be automatically be updated.
