

6-0004-EN-Design customizations for advanced users i.e....

Author:
ShopFactory

Created On: 09 Jul 2013 8:41 PM

IMPORTANT NOTES:

- a. Make sure you do not *accidentally* delete or omit important syntax such as } or ; (semicolon after the value) when editing the stylesheet and macro; otherwise, your shop template will be affected and won't display properly.
- b. After editing the *website.css* and/or *website.html* files, you may need to enable "**Rebuild All**" and preview your shop in external browser to see the changes take effect.
- c. The information provided below is only applicable to some website themes such as **8-BASE** template or **9-AAH** theme. Please be aware that all the elements included in a website header group will be affected if you reduce the height or modify the container - for example, in 8-BASE theme, the "Website Name" and "Site Slogan" will be affected if you reduce the height. In other website themes, **WebSiteHeader** section includes the following: *Index1 menu container, Language bar, Minicart, company image and site slogan* so you need to know the reason why the size of the WebsiteHeader is pre-determined is to make all these elements fit properly: Index 1 container, Company Image, Website Name, Site Slogan, Language dropdown bar, and Minicart. If the theme you are using affects the position of all other elements, then it will be treated as further customization - see important note below:
- d. **More importantly**, the steps below can be done by anyone who is knowledgeable in css coding and advanced html users. If further customizations are required, then it is considered outside our Support Scope and we will charge an extra fee for template customization requests.

1. Change website Header (banner image) height

To increase/decrease the height of the header, the merchant must edit the value in the **website.css** file found in **My DocumentsShopFactory V10 Websites<shop folder>Runtimecontentsstyles** folder

- » Close ShopFactory
- » Open Windows Explorer and then navigate to your project folder, *i.e. My DocumentsShopFactory V10 Websites<shop folder>Runtimecontentsstyles*
- » Right click on the *website.css* file and select "Open with..." -> Notepad

Find the line:

```
#WebSiteHeader {height:300px;}
```

And change the value to what you want *i.e. 190px;* (to make it smaller).

**Make sure you do not accidentally omit important syntax such as } or ; (semicolon after the value) when editing the website.css or website.html files; otherwise, your shop design will be affected and won't display properly. For example, the site header is no longer showing up completely - that may*

be because you have forgotten to add ; (semicolon) after the value you have just changed.

- » Save the *website.css* file and close Notepad
- » Open your shop in ShopFactory
- » Save and preview your shop in External browser to see the changes.

You may need to enable "Rebuild all" from the Settings menu and preview the shop again to see if the changes have taken effect.

Note: For templates with a shorter banner height for all other pages except the homepage, for example, Omnia demo shop (using *9-AAH website theme*) – where, homepage has taller height while other pages have reduced banner height - you can also reduce the SiteHeader height in other pages via *website.html* file.

- Open the **website.html** file from the "**<shop folder>**

TemplatesWebsite9-AAH-AA_1024parseLang" folder

- And then locate the IF statement: *If this is NOT the homepage*

- Change height value for **WebSiteHeader**

- Save and close Notepad.

- If you have the shop already opened in ShopFactory, click on the "**Refresh**" button on the toolbar.

2. Change the height of the Shop Name - find this line in the same *website.css* file:

```
#SiteHeading
```

```
{font-size:30px;background-color:transparent;font-weight:700;font-style:normal;line-height:1.2em;}
```

Then change the value of the line-height into something lesser than 1.2 em.

3. Change the banner slideshow (banner links) width – find this line in the same *website.css* file:

```
div#header * {width:764px ! important;}
```

4. Change the Index 1 width, for example **990px (to remove the scroll buttons)** - find this line in the same *website.css* file:

```
#Index1 and then change the width value to 990
```

*** if you have changed the *website.css* file to 990px, you need to edit the **website.html** file in the project folder –

```
<project folder>TemplatesWebsite<website theme>parseLang
```

Edit the macro - change the **scroll** value to 990:

```
<sf:macro object=&rdquo;LoadIndex1&rdquo; design=&rdquo;8-VTE_1&rdquo;  
orientation=&rdquo;Horizontal&rdquo; scroll=&rdquo;610&rdquo;  
showhomelink=&rdquo;true&rdquo; showlinkimagesublevels=&rdquo;false&rdquo;  
showlinkimagetoplevel=&rdquo;false&rdquo; />
```

5. Change the Company Logo dimensions

For example, I am using **8-BASE** theme – I need the company logo to be 500 x 104

» The company logo must have these actual dimensions (500 x 104) - edit using a photo editor i.e. MS Paint

» Edit the **website.html** to the exact dimensions **<project folder>TemplatesWebsite<website theme>parseLang**

```
<div id="CompanyImage">
<a href="index.html" title="">

</a>
</div>
```

» Edit the style sheet (website.css) as well by locating the **#CompanyImage img** line

#CompanyImage img { width: 500px !important; height: 104px !important}

4. Save the website.css file and close Notepad

5. Open your shop in ShopFactory

6. Save and preview your shop to see the changes.
